

How To Determine The Length Of A Boxed Chaise Cushion

- 1 A boxed chaise is essentially two cushions that are attached together with a fabric hinge or flap. This piece of fabric keeps both cushions in place on the chaise lounge frame.

- 2 The back portion of the chaise cushion is designed to sit on top of the seat portion. The final height of the back cushion will be **"less the thickness"** of the seat cushion.

- 3 Final chaise cushion back length (or height) equals length of the chaise back **MINUS** the thickness of the seat cushion.

FOR EXAMPLE - If the back of the chaise measures 34" From the top to where the seat starts, and the chaise seat is 4" thick, then you will need a 30" tall back cushion. If the seat of the chaise measures 50" from front to back, then you will need an overall cushion length of "80 inches with a hinge at 50".
